CUSTOMER RELATIONSHIP MANAGEMENT (CRM) SYSTEM FOR STUDENT ADMISSION PROCESS

A Project Synopisis Submitted for Internship

Submitted By:
Amruta Pandurang Mali

Internship Organization:
NexaNova Pro Tech

Role:
Application Developer Intern

Batch:

16 Jan Java Fullstack Hybrid

Under the Guidance of:
(Company Mentor Name)

Academic Year: 2025–2026

1. INTRODUCTION

In today's competitive educational environment, managing student enquiries and admissions efficiently is essential for institutions.Traditional manual systems often lead to inefficiencies, data mismanagement, and lack of proper tracking of student interactions.The proposed Customer Relationship Management (CRM) system is designed to automate and streamline the entire student admission lifecycle. It provides a centralized platform for managing student enquiries, tracking calls, scheduling follow-ups, and converting potential leads into confirmed admissions.The system also generates analytical reports for management to monitor performance and improve decision-making. By implementing this CRM system, institutions can improve operational efficiency, enhance communication tracking, and increase admission conversion rates.

2. PROBLEM STATEMENT

Educational institutions often face challenges in managing large volumes of student enquiries manually. There is no proper system to track calls and follow-ups, resulting in missed opportunities and low conversion rates.

Additionally, the absence of a centralized system makes it difficult to monitor counselor performance and generate meaningful reports. Therefore, there is a need for an automated CRM system to manage enquiries, track communication, and streamline the admission process efficiently.

3. RELEVANCE

The CRM system is highly relevant in the current digital era where institutions require efficient tools to manage operations. It helps in improving transparency, reducing manual effort, and enhancing productivity.

The system enables better communication between counselors and students, ensures proper tracking of enquiries, and supports data-driven decision-making through reports. It is especially useful for coaching institutes, colleges, and training organizations.

5. OBJECTIVES

1. To develop a centralized system for managing student enquiries efficiently
2. To track communication activities such as calls and follow-ups
3. To improve the conversion rate from enquiry to admission
4. To generate reports for monitoring and performance analysis

End

The development of the Customer Relationship Management (CRM) System for Student Admission follows a structured and systematic methodology. The process is divided into multiple phases to ensure proper design, implementation, and evaluation of the system.

Step 1: Requirement Analysis

In this phase, the requirements of the CRM system are analyzed based on the provided software specification document.

The system is designed to:

- Manage student enquiries
- Track calls and follow-ups
- Convert leads into admissions
- Generate reports for management
- Improve the admission process

User roles such as **Admin, Counselor, and Manager** are identified, and their responsibilities are defined. The core workflow (Enquiry → Calling → Follow-up → Admission → Reports) is finalized.

Step 2: System Design

In this phase, the system architecture and design are prepared.

2.1 Module Design

The system is divided into the following modules:

- Login & User Management
- Enquiry Management
- Calling Module
- Follow-up Module
- Admission Module

- Course Management
- Reports Module

2.2 Database Design

The following tables are designed:

- Users
- Enquiries
- Call_Records
- Followups
- Admissions
- Courses

Relationships between tables are defined using ER modeling.

2.3 Process Design

- Flowcharts are created for overall system flow
- Activity diagrams are prepared for each module
- Sequence and class diagrams are defined

Step 3: Enquiry Management Implementation

This phase focuses on handling student leads.

- Enquiry form is created with fields:
    - Name, Phone, Email, Course, City, Source, etc.
- Enquiry ID is auto-generated
- Enquiry is stored in the database
- Enquiry is assigned to a counselor (manual/auto)

Step 4: Calling Process Implementation

This module tracks communication with students.

- Counselor accesses assigned enquiries
- Call details are recorded:
  - Call date
  - Call status (Interested, Not Interested, Not Reachable, Call Later, CNR)
  - Remarks
- Call history is maintained for each enquiry
-

Step 5: Follow-up Management Implementation

This phase ensures proper engagement with interested students.

- Follow-up is scheduled for interested leads
- Follow-up details include:
  - Follow-up date
  - Status
  - Remarks
- System generates reminders for scheduled follow-ups
- Follow-up results are updated based on interaction

Step 6: Admission Conversion Implementation

This phase handles conversion of leads into admissions.

- Counselor selects course
- Enters fee details
- Records payment information:
  - Fees paid
  - Payment status
  - Payment type
  - Installments
- Admission record is generated
- Enquiry status is updated to **"Converted"**

Step 7: Course Management Implementation

- Admin adds and manages courses
- Course fees are defined
- Course list is maintained for selection during admission

Step 8: Reports Generation Implementation

The system generates analytical reports such as:

- Total enquiries
- Counselor-wise enquiries
- Follow-up reports
- Admission reports
- Conversion ratio

Reports can be filtered based on date and criteria.

Step 9: Business Logic Implementation

The core workflow logic is implemented:

- Enquiry created → Assigned to counselor
- Counselor calls student
- Decision:
    - Not Interested → Close enquiry
    - Interested → Schedule follow-up
- Follow-up conducted
- If student agrees → Convert to admission
- Admission stored in system

Step 10: Testing and Validation

The system is tested to ensure accuracy and reliability:

- Unit testing for individual modules
- Integration testing between modules
- Functional testing for system behavior
- Error handling and bug fixing

Step 11: Deployment

- System is deployed on local/server environment
- Database is configured
- Users are provided login credentials

Step 12: Evaluation and Maintenance

- System performance is monitored
- Feedback is collected from users
- Updates and improvements are made
- Maintenance ensures smooth functioning

7. SYSTEM REQUIREMENTS WITH JUSTIFICATION

Software Requirements

- Operating System: Windows/Linux
- Frontend: HTML, CSS, JavaScript
- Backend: Java (Spring Boot) / PHP / Node.js
- Database: MySQL

Hardware Requirements

- Processor: Intel i3 or above
- RAM: Minimum 4 GB
- Hard Disk: 500 GB
- Internet Connectivity

8. PROJECT OUTCOME

- Development of a fully functional CRM system
- Efficient management of student enquiries and follow-ups
- Improved admission conversion rate
- Better decision-making through reports and analytics
- Can be extended for research paper publication or participation in hackathons like SIH
